

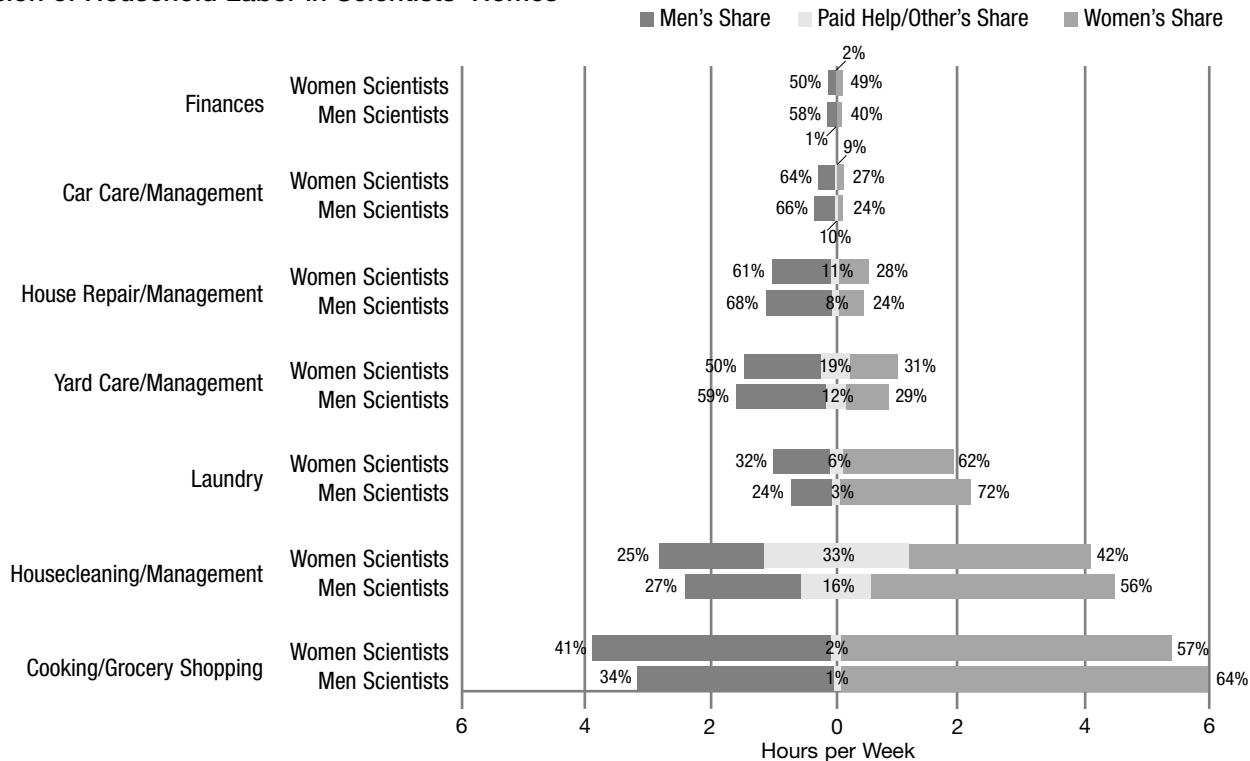

Figure 1
Division of Household Labor in Scientists' Homes

Note: For each task, respondents reported their own share of labor, paid help/other's share, and their partner's share. In all figures, percentages may not add to 100 due to rounding.

Women scientists do 54 percent of core household tasks (cooking, cleaning, and laundry) in their homes. Men scientists do 28 percent. These tasks consume an average of 19.3 hours a week. Men contribute more to yard and car care, house repair, and finance, but these tasks are periodic and estimated to take on average about 4.7 hours a week.
